

To update the Driver Station with the new image please use the following steps:

Download current version of the file from the FIRST website. Please make sure the the file is saved on your machine as DSUD_PKG.BIN, the use of upper or lower case letters does not matter. Keep in mind that on some PCs the file extensions (in this case .bin) may be hidden. Do not add this extension if this is true for your PC. Use a USB memory stick and load the new software (DSUD_PKG.BIN) onto it. Memory Sticks without any self running applications are the only type of USB device that works. Some USB sticks try to run as an external disk when plugged into a machine. This will not work with the Driver Station as it is a Linux based operating system (not Windows. Plug the USB memory stick into the DS. With the DS powered up, hold down the leftmost 2 buttons below the LCD display (UP/DOWN buttons. Wait a really long time until a prompt screen comes up (yes it is a long time 7 or 8 secs. Follow the instructions on the screen. NOTE: Up arrow is left most, Down arrow is center and Select arrow is right most LCD screen buttons. If after the Select button is pressed the DS display drops back quickly to the normal display then there is a problem with either the USB memory stick or the name of the image file.
